

Infeed publication

Publication on the elia.be website

Energy management

Summary	This document describes the data and hypotheses on which the online infeed publication is based. The added values for market players and for Elia as well as the more specific features of the infeed publication are described here.
Version	V 1.1
Date	05/12/2013

1 Introduction

BRPs are responsible for the balance of their energy injection and offtake portfolio on the Elia electrical grid. One of the sources for imbalance originates from the load and more specifically from the DSO load (increase in DER).

Currently, information at DSO level is only available on an ex-post basis (the earliest on M+2, for validated and allocated data). This is considered too late by ARPs wishing to adapt their imbalance position in real time.

This is the reason why participants in the balancing mechanism have asked Elia to help them by publishing real-time information on the injection of electricity from Elia's grid to DSO grids: this is called infeed.

Consequently, the purpose of *Infeed publication* is to supply the ARPs with sufficient information in near real time with the injection at each substation connected to the distribution grid.

In this way, the ARPs can use infeed data to detect deviations in consumption or production on the distribution grids and to better balance their portfolios on very short notice.

This publication can be consulted at www.elia.be under the section "Grid data".

2 Relevance to market players

In an ongoing effort to ensure **transparency** and provide information to the market, Elia publishes on its website a whole series of data directly associated with the balancing mechanism. This is of use to all market players, especially ARPs. The information of the infeed publication mainly covers:

- Information from the Elia substations feeding the distribution grid. This information includes location, region, EAN code, voltage level and the DSOs active on the substation.
- Near real-time information on the power injected from Elia to the distribution grid. The publication of these values is updated every 2 minute.

The data published by Elia is of great interest to many market players for a number of reasons:

- The data provided means that those users who have some type of flexibility, have information at their disposal enabling them to position themselves in relation to their competitors.
- ARPs can use the information to estimate their imbalance bill in near real time before it is issued by Elia.
- ARPs can use the data to manage their imbalance in real time.
- ARPs can use the information provided to quantify the impact of DER on their portfolios and to recalibrate their forecasting models accordingly.

3 Sourced data for publication

3.1. Which infeed?

The data used for publication is sourced directly from Elia's SCADA system. The SCADA system gathers together all metering pulses which are relevant to grid operation. Various telemeasurements are available for each injection. For publication purposes, the telemeasurement values are summed up per substation and, for some exceptions, corrections must be implemented (e.g. corrections for direct clients and infeed zoning). The published values are refreshed every two minute.

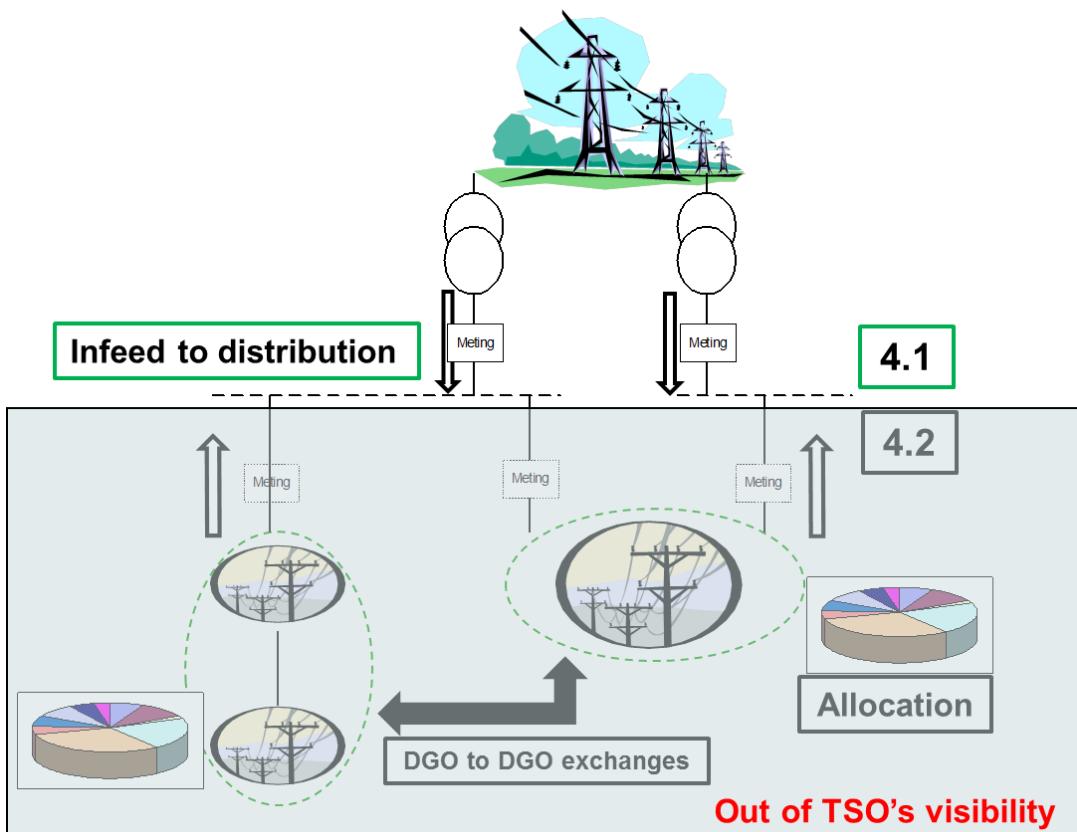

Figure 1: Published infeed data from the TSO side

Elia will only publish data of which it has direct visibility in real time. This means that the data provided will only originate from the transmissions side of the grid (Figure 1, section 4.1). Information and data from the distribution side of the grid, such as the infeed per DGO or DGO-to-DGO exchanges (Figure 1, section 4.2), are out of the TSOs visibility and will not be included into the infeed publication.

3.2. Exceptions – direct clients

In some injection stations, some of the feeders are strictly used by direct clients. For these substations Elia corrects the telemeasured values by eliminating the injection to the direct client as this is not considered an injection to the distribution grid. Elia has real-time measurement of energy off-take (or injection), albeit for all direct clients. For these cases, the substation and the maximum error one can expect on the published values is listed in the annexes of this document.

3.3. Exceptions - Zoning

Description of the situation

For certain injections to distribution grids, real-time grid operation is handled by other players. The best known example is INFRAZ a company which handles operations for PBE, IVEG, INTER-ENERGA and INFRAZ-WEST. Elia directly injects energy into the INFRAZ grid which INFRAZ then distributes to the different underlying distribution grid operators.

For these network situations, real-time telemeasurements of the infeed into the distribution grid are not available at a low voltage level (e.g. 11/15kV).

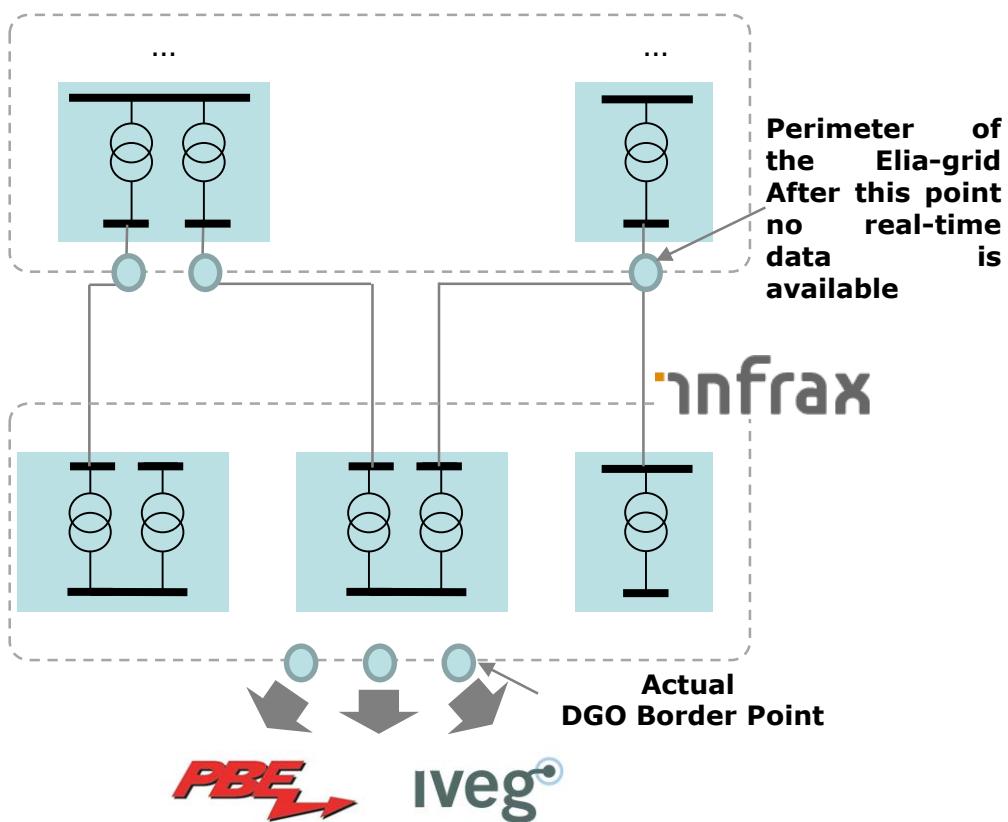

Figure 2: Illustration of the zoning design for INFRAZ

Method for calculating zoning infeed

As indicated in Figure 2, it is proposed to only publish the data to which Elia has access. The infeed to the InfraZ zone will be determined by summing all the available telemeasures situated at the border between the Elia grid and the InfraZ grid. The sum of all these telemeasures will be called a zoning in the publication.

In the annexes each substation included in the zoning (meaning substations which are part of the InfraZ or Tecteo zone) is listed.

3.4. What metering values are used?

The values used in the publication are near real-time telemeasurements directly sourced from Elia's SCADA-system.

Elia draws a distinction between two types of metering: quarter-hourly (validated) metering (or regulated meters), which Elia uses for invoicing to the various market players (ARPs, suppliers, etc.); and near real-time telemeasurements which Elia uses for its system operations and to which grid users can subscribe in order to consult their raw consumption and generation data.

The differences between quarter-hourly (validated) metering values and real-time measurements are described below:

- Telemeasurement only gives an **instantaneous value** at a predefined time interval (MW every x minutes) while the quarter-hourly metering values are energy values (MWh), a **meter counts continuously** the current and thus takes into account the full course of the quarter-hour. Based on the snapshot values it is possible to estimate the energy, but if the measurements often fluctuate, a lot of information will not be recorded and the energy estimate will be wrong. Also, small fluctuations will not get registered by the SCADA system due to filters within the system.
- Telemeasurements use a transducer to transform the measured pulses into kW of MW. The transducer is not a very precise device whereas a meter does not use a transducer which makes it more precise. **The error percentage for near-real-time measurements is within a band of 2% while the error percentage for metering is about 0.2%.**
- **Meters** have an internal clock which is **constantly synchronised** and the meters are **regularly calibrated**, while **near-real-time measurements have no synchronisation**.
- The very short period of time within which the **telemeasured values** are made available to Elia customers means that these values are **not validated**. If, due to a technical problem, it proves impossible to carry out the near-real-time measurement, these data will be lost for good. All the **meters** installed by Elia have a **no-break system**, alarm relays and a system for (locally) memorising and transmitting data.

4 Features of the infeed publication

General presentation of the publication

The publication consists of one large data table. The structure of the “infeed publication” table is described below. At the top of the table the timestamp for the published values is displayed. The rows show the measured substation which is connected to the distribution grid its characteristics and the last column shows measured value of the infeed delivered through the substation in question.

INFEED

Explanation of the published values: The list presents the last measures received by Elia for injection station from infeed from Elia to Belgian Distribution System Operators (DSO). This list can be filtered on DSO field.

All values are in MW and voltage stations level are in KV.

Last values displayed: 08/10/2013 10:35							
EAN code	Injection station	Location	Voltage Level	DSO		Region	Value
541453161252993345	AALNO 15	AALST	15	INTERGEM	Flanders	-31.008	
541453198270815618	AALST 15	AALST	15	INTERGEM	Flanders	-20.882

541453172167605162	AMEL 15	AMEL/AMBLÈVE	15	INTEREST	Wallonia	-0.390	
000000000000000076	AMERI000	BRUSSEL (ELSENE)	11	SIBELGA	Brussels	-29.843	
541453194170778985	AMPSI 15	AMPSIN	15	TECTEO	Wallonia	-3.168	
541453115502566094	ANGLE 15	ANTHISNES	15	TECTEO	Wallonia	-27.126	

Additional details about the information published in the different columns are given below:

EAN code	string of 18 digits representing the injection station's EAN code Remark: The zonings do not follow the EAN code: These start with 0000000
Injection station	name of the injection station
Location	the name of the city where the injection station is located
Voltage level	the voltage level of the injection station
DSO	the DSOs associated with this injection station
Region	region associated with the injection station
Value	information about the last measured value at the injection station

The data table can be filtered by DSO, when clicking on the top row of the DSO column the browser presents the list of those DSOs having at least one injection station at the time of the publication. The list is sorted alphabetically and the user can select one DSO from the list.

Voltage Level	DSO
15	AIEG
15	AIESH
12	GASELWEST
10	IDEG
	IEH
	INTERGEM
	IMEWO
	IVERLEK/PBE
	TECTEO
	SIBELGA

Remark: Multiple DSOs can be associated with the same injection line. But each DSO can be chosen from the list.

The measured values can have different signs. Below you can see the sign convention used for the infeed publication.

sign	explanation
-	The value represents injected energy going from the TSO to the distribution grid.
+	The value represents energy offtake going from the distribution grid to the TSO.
0	No energy injection/offtake.
	Measure is not valid, indicates a technical defect with the measurements.

4.1. Export of historical data

Reports can be downloaded from the infeed page containing historical data of the published data (.CSV file). The reports can be retrieved by selecting the desired month from the dropdown list.

Historical data

Please click on the following link to view historical data on last data (one month):

Current selection ▾

[Click here to access the B2B XML-services](#)

4.2. B2B XML service

In order to improve the usability of the published data Elia has set up a web service to regularly send the published information in the form of a XML message.

For more information about the B2B XML service [click here](#).

5 Contact information

Should you require assistance or more information, support is available via email at balancing.publications@elia.be.

Disclaimer:

All data published on the webpage are for information purposes only and are not legally binding. Each user acknowledges that he/she uses such published data and information at his/her own risk.

Elia hereby excludes all liability (whether in contract, tort, delict, quasi-delict, statute or strict liability) in case of total or partial interruption of the publications as well as for any type of damage, direct or indirect, consequential, or of any other nature, resulting from an incorrect understanding or the use of this information for any reason.

6 Glossary

Term	Description
<i>ARP</i>	Access Responsible Party
<i>BRP</i>	Balance Responsible Party. Equivalent of "ARP" at Elia.
<i>MW</i>	Megawatt
<i>DGO</i>	Distribution Grid Operator (equivalent of DSO)
<i>DSO</i>	Distribution System Operator
<i>Infeed</i>	The energy that is transferred from the TSO (Elia) grid to the Distributor (DSOs) grid via the Injection stations
<i>DGO Border Point</i>	Equivalent of Injection station. "Injection station" is used in Infeed while "DGO Border Point " is used in CC.
<i>Injection station</i>	The station where the infeed from Elia to the DSO Grid is performed.
<i>Historical monthly files</i>	The .CSV file containing one month of values for all injection stations valid at the start of said month
<i>SCADA</i>	Supervisory Control And Data Acquisition system

7 Annexes

7.1. Infeed injection stations

Hereunder a table listing which substations, DSO's and their corresponding EAN code are included in the publication.

EAN code	Display name	Location	DSO
